2018 Adolescent Sexual Health Report

All data in this report is specific to Waseca County unless noted otherwise.

Pregnancy and Birth

State Comparison: Since 1990, teen pregnancy and birth rates have decreased significantly in Minnesota. Although rates increased in 2006 and 2007, data from 2008-2016 indicate a return to declining pregnancy and birth rates among teens.

In 2016, 3,004 teens aged 15-19 and 41 teens under the age of 15 became pregnant and 2,201 teens aged 15-19 and 15 teens under the age of 15 gave birth. Every day in 2016, approximately 8 adolescents became pregnant and 6 gave birth in Minnesota.

*Numbers not reported for counties with <20 births or pregnancies

National Comparison: From 1991 to 2016, the birth rate for youth aged 15–19 in the US dropped 67%, reaching a record low of 20.3 per 1,000 in 2016.

The overall decline in the adolescent birth rate over the past two decades has been attributed to increased use of the most effective contraceptive methods (IUDs and implants) as well as delayed initiation of sexual activity.

Despite reaching historic lows in 2016, adolescent pregnancy and birth rates in the U.S. continue to be the highest among developed nations.

Sexually Transmitted Infections (STIs)

State Comparison: In 2017, the chlamydia rate among 15-19 year olds in Minnesota was 1,606 per 100,000. This is a slight decrease of 0.6% from 1,617 per 100,000 in 2016.

In 2017, the gonorrhea rate among 15-19 year olds was 316 per 100,000. This is an increase of 29.5% from 244 per 100,000 in 2016. Even though they account for only 7% of the Minnesota population, adolescents aged 15-19 accounted for 25% of chlamydia and 18% of gonorrhea cases in 2017.

Adolescents and young adults experience a high incidence of STIs compared to other age groups. This disparity is likely related to a lack of access to STI prevention services, socioeconomic status, discomfort with facilities designed for adults and concerns about confidentiality.

Infants born at low birth weight are more likely than infants born at normal weight to die within the first year of life. There are many factors associated with giving birth to a low birth weight infant, such as maternal age, health, nutrition, access to prenatal care, education level and contact with alcohol, cigarette smoke and lead.
